To get a better sense of the type of effects you'll be able to create with the app, a good place to start is with the presets. While using the app is quick, and you can adjust the different effects after leaving an image open in Photoshop, this is something you don't have to do as often with the presets, as is the case with Lightroom. You can lock the entire app for effect changes. This is especially convenient when using the app on-the-go with the iPad. I also want to point out that while I found the app more intuitive to use than a lot of other apps I've played with, the iPad's lack of a physical keyboard can be an annoyance. Still, it's never been something I've found objectionable and in fact, the more minimalist format makes sense once you get used to the interface. The app is also surprisingly good for batch processing. You may want to do 10 or more photos at a time, and you're provided with a number of digital pipelines, from simple actions to modules, that you can apply to your images. All of them are targeted directly at the iPad's extensions. Initially, a Photoshop For iPad page in the App Store claimed the app only supported 4096 x 2048 resolution photos, but an update has since added support for 4096 x 4096 screens. I've still been finding some weird issues when resizing images that crop at less than this size, but at least I finally have an option. Adobe has done a good job at incorporating AI technology into Photoshop. However, the AI algorithms don't always successfully work. Even CMYK color control failures still occur. Of the current AI-powered features, Adobe Clarity's selection tool is great, but the app is still in beta. One of the best additions, though, is Adobe's new AI Facial Recognition technology.

As timeliness goes, the old Photoshop has been a tardy mammy. In our Spring event at Vevo in New York City, we revealed the first native version of Photoshop, which is fittingly introduced today to mark the 32nd anniversary of the first Photoshop release. The beloved and storied 7.0 name has been retired and the Sustainable Growth initiative is now carrying the mantle of Photoshop forward -- fittingly, given it was born at code name Sustainable Growth. Along with the shift to a native application, you'll also find many of the popular Photoshop CS6 features have been brought to the web, including user-defined layer groups, Quick Selection, image adjustments, content-aware Fill, Matte Flow, Smart Objects, and the Shapes tool. These updates will make it much easier to work with an image as the web, whether you're uploading images to a website, creating a using images in your own WebGL apps, or sharing images to a variety of social networks. In addition, the web is also a great way to create dynamic documents such as presentations, site home pages, mockups, and so on. We encourage you to start experimenting with this new format, and I've included a few links at the end of the article to get you on your way.
