The big difference between Exchange 2000 and 2003 is that 2003 is now a service. Exchange 2000 is still a product. Exchange 2010 is a subscription and the product exists for server only. So there is some confusion and a recent question was posted to the exchange blog... What version of Exchange is available for Exchange 2007? If you are using Exchange 2007, then you have a 2010 SP1 (or you are in preview). You can download the software from here: However, you cannot activate the license until 2010 SP1 is released. The virtual machine is a backup of my current server so I can go back to it at any time and run an in-place upgrade if need be. I was able to upgrade the master server to Windows 2008 using the in-place upgrade method. I still have to run some script to get my emails setup on it. So far, everything is fine. I ran the OWA service backup and restore. I got a message saying that the running user account was modified and it should be done on a different user account. In this case, it was the backup user. The user was not able to be renamed because the user name is already taken. I checked the user account in AD that was causing this error and in that case, it was the backup user account. I disabled that account and tried to restore it again and it was now fine. The backup user account was not the running user account. I was able to recreate the service
